

P12 electrode coverage (colored by area) and the brain-as-LLM linearization model

P12: 151 bipolar pairs, 14 sEEG leads

- dorsolateral prefrontal
LAF (9/11 pairs clean)
- ventrolateral prefrontal
LOF, RAF (11/24 pairs clean)
- premotor / dorsomedial frontal
LMF, LVF, RMF, RVF (33/42 pairs clean)
- sensorimotor
LAI, LPF (24/24 pairs clean)
- temporal / peri-insular
RAT, RMT (16/18 pairs clean)
- posterior temporal
LPT (5/8 pairs clean)
- parieto-occipital
LAO, LPO (16/24 pairs clean)
- ✕ ictal-onset pairs (excluded from all fits)

labels are coarse, coordinate-derived (lead mean MNI);
markers = bipolar-pair midpoints

the same electrodes as an LLM-style token stream

$$\text{LLM: } e_{t+1} \approx W e_t + w \quad \text{brain: } x(t+\Delta) = A x(t) + b + \hat{w}$$

A: local linear map
(shown: LVF θ , $\Delta=20$ ms)
