

# Stim-block context shift across the montage — frozen per-lead models (P12 · $\theta$ )

$\Delta R^2 = \text{OOD} - \text{ID}$  (frozen  $Ax + b$ ) at 200 ms, 8/12 leads degrade by more than 0.02  $R^2$   
 $\Delta = 200$  ms: points below diagonal = OOD degradation
