

In-distribution TruthfulQA

Changes are relative to the same model without steering; $\text{QAT} = \text{True} \times \min(\text{relevance}/2, \text{fluency}/2)$.

(a) Truthfulness gain

(b) Quality-adjusted gain

(c) H_∞ advantage

★ marks the best method in each row. The red outline identifies H_∞ . Values use reported means; ODESteer is excluded because its implementation is invalid.
