

$\theta$ -band local linearization holds across the whole montage — P12, NoStim1+NoStim2 combined  
 251 trials, tokens 0.04–3.5 s (vs 1.5 s before), split 151/50/50 whole trials  
 test  $R^2$  of  $Ax + b$  (frozen  $\lambda$  from val)

$\Delta R^2 = \text{linear} - \text{persistence}$

conclusion over  $\sim 2.3\times$  more trials and  $\sim 2.3\times$  longer window: linear map beats persistence in every lead at long horizons (mean  $\Delta R^2 = +0.06$  @100 ms,  $+0.39$  @200 ms); short-horizon  $R^2$  stays near ceiling.
