

Potential reviewer critique	Measured countermeasure
The dynamic-game recursion is too slow to scale.	H-infinity synthesis takes 0.1245 s on the 16-layer, rank-8 production problem; all 100 bootstrap refits converged in at most 24 iterations.
State-aware control materially slows decoding.	H-infinity takes 5.459 ms/token, only 0.050 ms/token above A-LQR under identical prompts and forced token counts.
Robust control requires additional deployment.	Original, A-LQR, and H-infinity each peak at 2.882 GB allocated VRAM.
